

About the Project

DiaHub is an early-stage project based in Aarhus, Denmark. Our mission is to simplify diabetes monitoring and make it more accessible and reliable for everyone living with diabetes. DiaHub acts as a personal diabetes hub – a keychain-sized device that receives glucose data remotely through the internet and displays it in real time, without the need for a smartphone. It helps users and parents stay informed and avoid missing critical glucose alerts, keeping everything related to diabetes management in one place. A fully working prototype and 3D model have been developed, and the next step is to secure funding for pilot testing in Denmark.

Problem

- Smartphones send too many notifications, making it easy to miss critical glucose alerts.
- Switching between several diabetes apps (glucose, insulin reminders, alarms) is stressful and inconvenient.
- Smartwatches are not for everyone - short battery life, higher cost, and not all users (especially children or elderly) can use them.
- Parents and caregivers need a simple way to see glucose data instantly without unlocking phones or opening apps.
- Elderly users find mobile apps too complex and prefer a dedicated, always-on device.
- Battery dependency is a major issue — phones and watches drain quickly, while a dedicated device can run for weeks.

Special Case: Children & Elderly

Parents and caregivers often cannot follow glucose levels in real time during school or work hours, creating stress and uncertainty.

Smartphones & Smartwatches are not ideal

Expensive, fragile, distracting, and sometimes not allowed (e.g. in schools or workplaces).

Everyday Challenge

Over 320,000 people in Denmark live with diabetes. Monitoring glucose constantly is stressful and current solutions are not always practical.

DiaHub

Solutions

DiaHub is a compact hub that simplifies glucose monitoring and daily diabetes management.

- Displays real-time glucose data directly on the device - no phone or smartwatch needed.
- Works remotely through the internet, allowing parents and caregivers to follow glucose levels from anywhere.
- Combines glucose display, sound alerts, and insulin reminders in one simple interface.
- Extremely power-efficient - can run for weeks on a single charge.
- Always visible, distraction-free, and easy to use for all ages.
- Designed as an affordable, practical companion — not a medical device.

Market

A convenient, affordable add-on for existing CGM users - designed for everyday life, not clinical use.

Accessibility

Portable, lightweight, and discreet — works anywhere: schools, offices, or at home.

Technology

Connects via Wi-Fi or cellular to receive glucose data securely and display it in real time.

End User

People with diabetes — and their families — who want a reliable, dedicated way to stay informed and never miss important alerts.

Product Overview

We have developed a fully working prototype that demonstrates the core functionality of DiaHub – receiving glucose data remotely and displaying it in real time. The prototype confirms technical feasibility and shows that the concept works reliably in practice. A 3D model of the final keychain-sized design has also been created, ensuring portability, durability, and simplicity for everyday use. The next goal is to secure funding to move from prototype to a small pilot production for real-world testing and user feedback.

Key Features

- Real-time glucose display from existing compatible data sources
- Compact keychain-sized form factor
- Always-on OLED / e-ink display for clear visibility and low power use
- Long battery life – works for weeks on a single charge
- Simple, intuitive interface with sound alerts and insulin reminders

Development Stage:

Functional prototype completed and tested on a breadboard. 3D model of the final design created. Next goal is to secure funding to build the first physical units for testing and user validation.

Market Size

\$ 1.4 Billion – Global Diabetes Accessories Market

The worldwide market for diabetes-related accessories (non-medical, consumer-focused add-ons such as cases, wearables, monitoring companions) is estimated at over \$1.4B annually. This includes growing demand for simple digital health gadgets that make daily diabetes management easier.

\$200 Million – European Digital Health Accessories

In Europe alone, over 60 million people live with diabetes. Many already use CGM (Continuous Glucose Monitoring) systems, but there is a clear demand for affordable, non-medical accessories that extend functionality. This represents a \$200M+ opportunity in the EU.

\$10 Million – Nordic Early Adopter Market

Denmark has over 320,000 people with diabetes, including 35,000 children. The Nordic region is known for high adoption of digital health solutions. Starting locally in Denmark and scaling across the Nordics gives an obtainable market of ~\$10M in the first years.
